(URL, http://www.sanger.ac.uk/Projects/M_tuberculosis/) CDS have been renumbered from the original cosmid submissions but the old gene designations are in brackets after the new gene numbers. Gene prediction was based on a Hidden Markov Model of TB genes implemented in TBparse (Krogh) supplemented with visual inspection of positional base preference in codons, especially where there is an increase in the observed/expected third position G + CAUTION: In some cases we may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, gtg, or ttg) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bacteria; Firmicutes: Mactionbacteria; Actinobacteridae;

cubmilted (11-JUN-1998) Submitted on behalf of the Mycobacterium tuberculosis sequencing and mapping teams, Sanger Centre, Wellcome Trust Genome Campus, Hinxton, Cambridge CBIO ISA Unite de Genetique Moleculaire Bacterienne, Institut Pasteur, 28 rue du Docteur Roux, 75724 Paris Cedex 15, France E-mail: parkhill@sanger.ac.uk On Jun 27, 1998 this sequence version replaced gi:1806198.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               URL, http://www.sanger.ac.uk/Projects/M_tuberculosis/) CDS have been renumbered from the original cosmid submissions but the old gene designations are in brackets after the new gene numbers. Gene prediction was based on a Hidden Markov Model of TB genes implemented in TBparse (Krogh) supplemented with visual inspection of positional base preference in codons, especially where there is an increase in the observed/expected third position G + C. CAUTION: In some cases we may not have predicted the correct initiation codon. Where possible we choose an initiation codon binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream codon).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          penicillin binding proteins and eg DAC_STRSQ P15555 d-alanyl-d-alanine carboxypeptidase (406 aa), fasta srores, opt. 382,E(): 3.1e-17, (28.0% identity in 379 aa overlap); containsPS00013 Prokaryotic membrane lipoprotein /codon eter.

```
This DNA sequence comprises Mycobacterium bovis BCG deletion
sequence BCGdelta3. A specific genetic deletion of this region
ceaults in an avivalence phenotype of the mycobacterium. 2 other
celetion regions (see AA713535 and AA73535) have also been detected.
Identification involved screening a BCG cosmid library with a
redicible deprobe obtained following DNA subtraction between
virulent Mycobacterium tuberculosis H37Rv and avirulent BCG.
The deletions provide useful markers for the identification of an
avirulent, or a virulent, mycobacterial phenotype. Determination
of avirulence requires the detection of the presence or absence of
the deletion; the deletions are detected either by detecting the
presence or absence of deletion junctions (see AA733538-46), or by
detecting the presence or absence of the sequences contained within
the deletion. Deletion polypeptides are used as components of
Detecting markers for avirulence in Mycobacterium - used in production of vaccines against bacterial infection, and to detect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 12412 BP; 2146 A; 4273 C; 3876 G; 1917 T; 200 other;

                                                                                                                                                 The isolated DNA molecule of the invention confers on M. tuberculosis an ability to enter cells and to survive within macrophages. It encodes a polypeptide having a mol. Wt. of about 50-55 kDa, pref. 52 kDa. The AA sequence represents a highly hydrophilic protein with a hydroj hobic region at its carboxy terminus. It could be a secreted protein, a cytoplasmic protein, or a surface protein with list carboxy terminus attached to the outer membrane of the organism. The deduced AA sequence is in AAR71931.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    554 acctuaccgacaccgaacgcgcccgcaaacgcggcatcaccctqagcaaccaqcaac

A DNA molecule (AAT3165b) confers on Mycobacterium tuberculosis an ability to enter mammalian cells and to survive within macrophages. The encoded protein sequence is given in AAM02301. The DNA was obtd. by ligating M. tuberculosis genomic DNA fragments into pBluescript II vector and screening recombinant E. coli strains for HeLa cellminsus colores. The DNA includes 2 separate coding regions (see also AAT31657-58) confine for the cell entry (AAM02302) and macrophage survival (AAM02301) proteins. He can be used to produce the cellular uptake proteins used as vaccines of to facilitate uptake of other

The protein can be used in a vaccine to prevent M. tuberculosis infection, and provide for the uptake in cells of, e.g. antibiotics, DNA fragments or anti-neoplastic agents. Antibodies raised against it can be used to treat mammals already exposed to

It can be incorporated into a vector and used for prodn. of recombinant macrophage survival protein, which is useful in vaccines or for facilitating uptake of other materials, e.g., therapeutic genes, into mammalian cells. A second DNA molecule (AAA13657) codes for a protein (AAM01302) that confers on M. tuberculosis the ability to enter mammalian cells.

                                                                                                                                                                                              The present sequence encodes a Mycobacterium tuberculosis cellular uptake protein fragment, which conters on M. tuberculosis an ability to survive within macrophages.

The protein can be used in a vaccine to prevent M. tuberculosis infection, and provide for the uptake in cells of, e.g. antibiotics, DNA fragments or anti-reoplastic agents. Antibodies raised against it can be used to treat mammals already exposed to M. tuberculosis, to induce a passive immunity and prevent disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            gaceteaceqacarryaangegreegraaaegeggcateaceetgagcaaceageaatae

Also described are: (1) polypeptides encoded by all or part of the DNA; (2) expression vectors containing the DNA; (3) host cells transformed by the fectors; (4) preparation of the polypeptides by culture of the transformants; (5) preparation of avermectin aglycon or its derivatives by culture of transformed avermectin producing microorganisms; and (6) oligonucleotides of 5-60 bases in length containing sense or antisense sequences from the avermectin aglycon synthase DNA. The enzymes are useful for the production of modified forms of avermectin and of the intermediates in its blosynthesis, for use as drugs, veterinary drugs and agrochemicals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Avermectin aglycone synthase DNA and proteins encoded by all or part of it for the production of avermectin and its derivatives for drug and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       21482 gatacaccetegeceaegecegegegegtgttegaceaeegegeeaeeeteategeegeeg 21541

The present invention describes a library of human polynucleotides comprising the sequences given in AAZ12532 to AAZ17779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one of the 5248 polynuclectide sequences given in AAZ1233 to AAZ17779. The polynuclectides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, mapping, tissue typing or profilling, forensics, genetic analysis and detection of polymorphisms. Polypeptides encoded by the polynuclectides and be used for raising antibodies for experimental, diagnostic and therapeutic purposes. The polynuclectides may also be used to construct arrays for diagnostics (which may be used to determine function of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  encoded protein); and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to identify a genetic predisposition or susceptibility to a disease such as cancer). "he polynucleotides of the invention are especially used in the diagnosis, prognosis and management of colorectal cancer, breast cancer, and lung cancer. The polynucleotides can also be used to screen for
                                                                                                                                                                                                                                                                                               Crkvenjakov R, Dickson M, Drmanac R, Drmanac S;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of DNA encoding the first 2 modules of the avermectin polyketide synthase (PKS) of Streptomyces avermitilis. The invention relates to nucleic acids encoding a Type I PKS such as avermectin in which a polylinker with multiple restriction sites replaces or I more PKS genes encoding enzymes associated with reduction. Novel PKS are provided in which is which the reductive loop in a selected module of the Type I PKS is replaced with the equivalent segment from the same or different PKS gene cluster or by a mutated or synthetic segment. Vectors and host cells, and methods for producing novel polyketides by culturing host cells are claimed. The polyketides by culturing host cells are claimed. The polyketides obtained are useful as antibiotics and insecticides. Fermentation products

The prescut sequence represents an NheII-XhoII fragment that encodes module 8 of te FK-520 polyketide synthase (PKS) gene cluster with the endoqueous acyltransferase (AT) domain replaced by the AT domain of endogenous acyltransferase (AT) domain replaced by the AT domain of module 12 of the rapamycin PKS (which is specific for malonyl CoA).

FK-506 is a potent immunosuppressants, and acts through intial formation of an intermediate complex with protein immunophilins known as FK-506 binding proteins. The nucleic acids are used for producing polyketide compounds. The polyketide compounds can be used as immunosuppressants to prevent or treat transplant rejection, graft-versus-host disease or uveitis. They can also be used for treating e.g. alopecia universalis, autoimmune chronic active hepatitis, inflammatory bowel disease, multiple sclerosis, primary biliary cirrhosis, or scleroderma. They also have neurotrophic activity and can be used to promote neurons in the outgrowth in NGF-treated PC12 cells and in sensory neuronal cultures, and in intact animals, they promote regrowth of damaged facial and control of the brain. They can also be used for treating e.g. Parkinson's disease, also be used for treating e.g. Parkinson's disease, better the prain inplury, or peripheral neuropathies. They can also be used in agricultural and control of the prain in a proper prop New isolated polyketide synthase nucleic acid and polyketide compounds, useful for treating e.g. transplant rejection, uveitis, multiple sclerosis, Alzheimer's disease, Parkinson's disease, stroke, or Wu K; ů, Example 1; Page 82-85; 126pp; English. New isolated polyketide synthase nucleic acid and polyketide compounds, useful for treating e.g. transplant rejection, uveitis, multiple sclerosis, Alzheimer's disease, Parkinson's disease, stroke, or peripheral neuropathy P-PSDB; AAY84725

Example 1; Page 76-79; 126pp; English.

The present sequence represents an AvrII-XhoII fragment that encodes module 8 of te FK-520 polyketide synthase (PKS) gene cluster with the endogenous acyltransferase (AT) domain replaced by the AT domain of module 12 of the rapamycin PKS (which is specific for malonyl units). FK-506 is a potent immunosuppressants, and acts through intial formation of an intermediate complex with protein immunophilins known as FK-506 binding proteins. The nucleic acids are used for producing polyketide

be used as immunosuppressants to
                             uveitis. They can also be used for treating e.g. alopecia universalis, autoimmune chronic active hepatitis, inflammatory bowel disease, multiple sclerosis, primary biliary cirrhosis, or scleroderma. They also have neurotrophic activity and can be used to promote neurite outgrowth in NGF-treated Poll cells and in sensory neuronal cultures, and in intact animals, they promote regrowth of damaged facial and sciatic nerves, and repair lesioned serotonin and dopamine neurons in the brain. They can also be used for treating e.g. Parkinson's disease, Alzheimer's disease, stroke, traumatic spinal cord and brain injury, or peripheral neuropathies. They can also be used in agricultural and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        acgracegacateacegagetgacetggeetgeggerecqaeaaeegartryerygadad 1247

module 8 of the FK-520 polyectics an international regions. The product of the repeated of the FK-520 polyectics of FKS) gene cluster with the cudogenous acyltranslerase (AT) domain replaced by the AT domain of module 13 of the repanying the FK by the AT domain of FK-506 is a potent immunosuppressure; and acts through infal formation of an intermediate complex with protein immunosphilins known as FK-506 binding proteins. The moticie acids are used for producing professure in the moticie acids are used for producing professure to prevent or treat transplant rejection, graft-versus-host disease or uveitis. The polyketide compounds can be used as immunosuppressants to prevent or treat transplant rejection, graft-versus-host disease or uveitis. The bolyketide compounds can sobe used for inversalis, multiple sclerosis, primary billary cirrhosis, or scleroderma. They also have neurotrophic activity and can be used to promote neurine cuttree had in intact animals, they promote regrowth of damaged facial and scient nerves, and repair lesioned serotonin and dopamine neurons in the brain. They can also be used for treating e.g. Parkinson's disease, Alzheiner's disease, stroke, traumatic spinal cord and brain injury, or peripheral neuropathies. They can also be used in agricultural and

module 8 of the FK-520 polykeines an AVIII ANOII Inguinel Lifet which the endogenous acyltransferase (AT) domain replaced by the AT domain of endogenous acyltransferase (AT) domain replaced by the AT domain of module 13 of the rapamycoin PKS (which is specific for methylmalonyl CoA). FK-506 is a potent immunosuppressants, and acts through intial formation of an intermediate complex with protein immunophilins known as FK-506 binding proteins. The nucleic acids are used for producing polyketide compounds can be used as immunosuppressants to prevent or treat transplant rejection, graft-versus-host disease or uveitis. They can also be used for treating e.g. alopecia universalis, multiple sclerosis, primary bilary cirrhosis, or scleroderma. They also have neurotrophic activity and can be used to promote neurite outgrowth in NGF-treated PCI2 cells and in sensory neuronal cultures,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and in intact animals, they promote regrowth of damaged facial and sciatic nerves, and repair lesioned serotonin and dopamine neurons in the brain. They can also be used for treating e.g. Parkinson's disease, Alzheimer's disease, stroke, traumatic spinal cord and brain injury, or peripheral neuropathies. They can also be used in agricultural and
                                                                                                                                                                                                                            New isolated polyketide synthase nucleic acid and polyketide compounds,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1187
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1188 acgcaccgacatcaccgagctgaccctggcctgcggccccgacaaccgactcgccgaaaa 1247

The present sequence represents DNA which encodes avermectin aglycon synthase proteins. Also described are: (1) polypeptides encoded by all or part of the DNA; (2) expression vectors containing the DNA; (3) host cells transformed by the vectors; (4) preparation of the polypeptides by culture of the transformants; (5) preparation of avermectin aglycon or its derivatives by culture of transformed evermectin-producing microorganisms; and (6) oligonucleotides of 5-60 bases in length containing sense or antisense sequences from the avermectin aglycon synthase DNA. The enzymes are useful for the production of modified forms of avermectin and of the intermediates in its blosynthesis, for use as drugs, veterinary drugs and agrochemicals.
                                                                                                             Avermectin aglycone synthase DNA and proteins encoded by all or part it for the production of avermectin and its derivatives for drug and
